

## INDIA

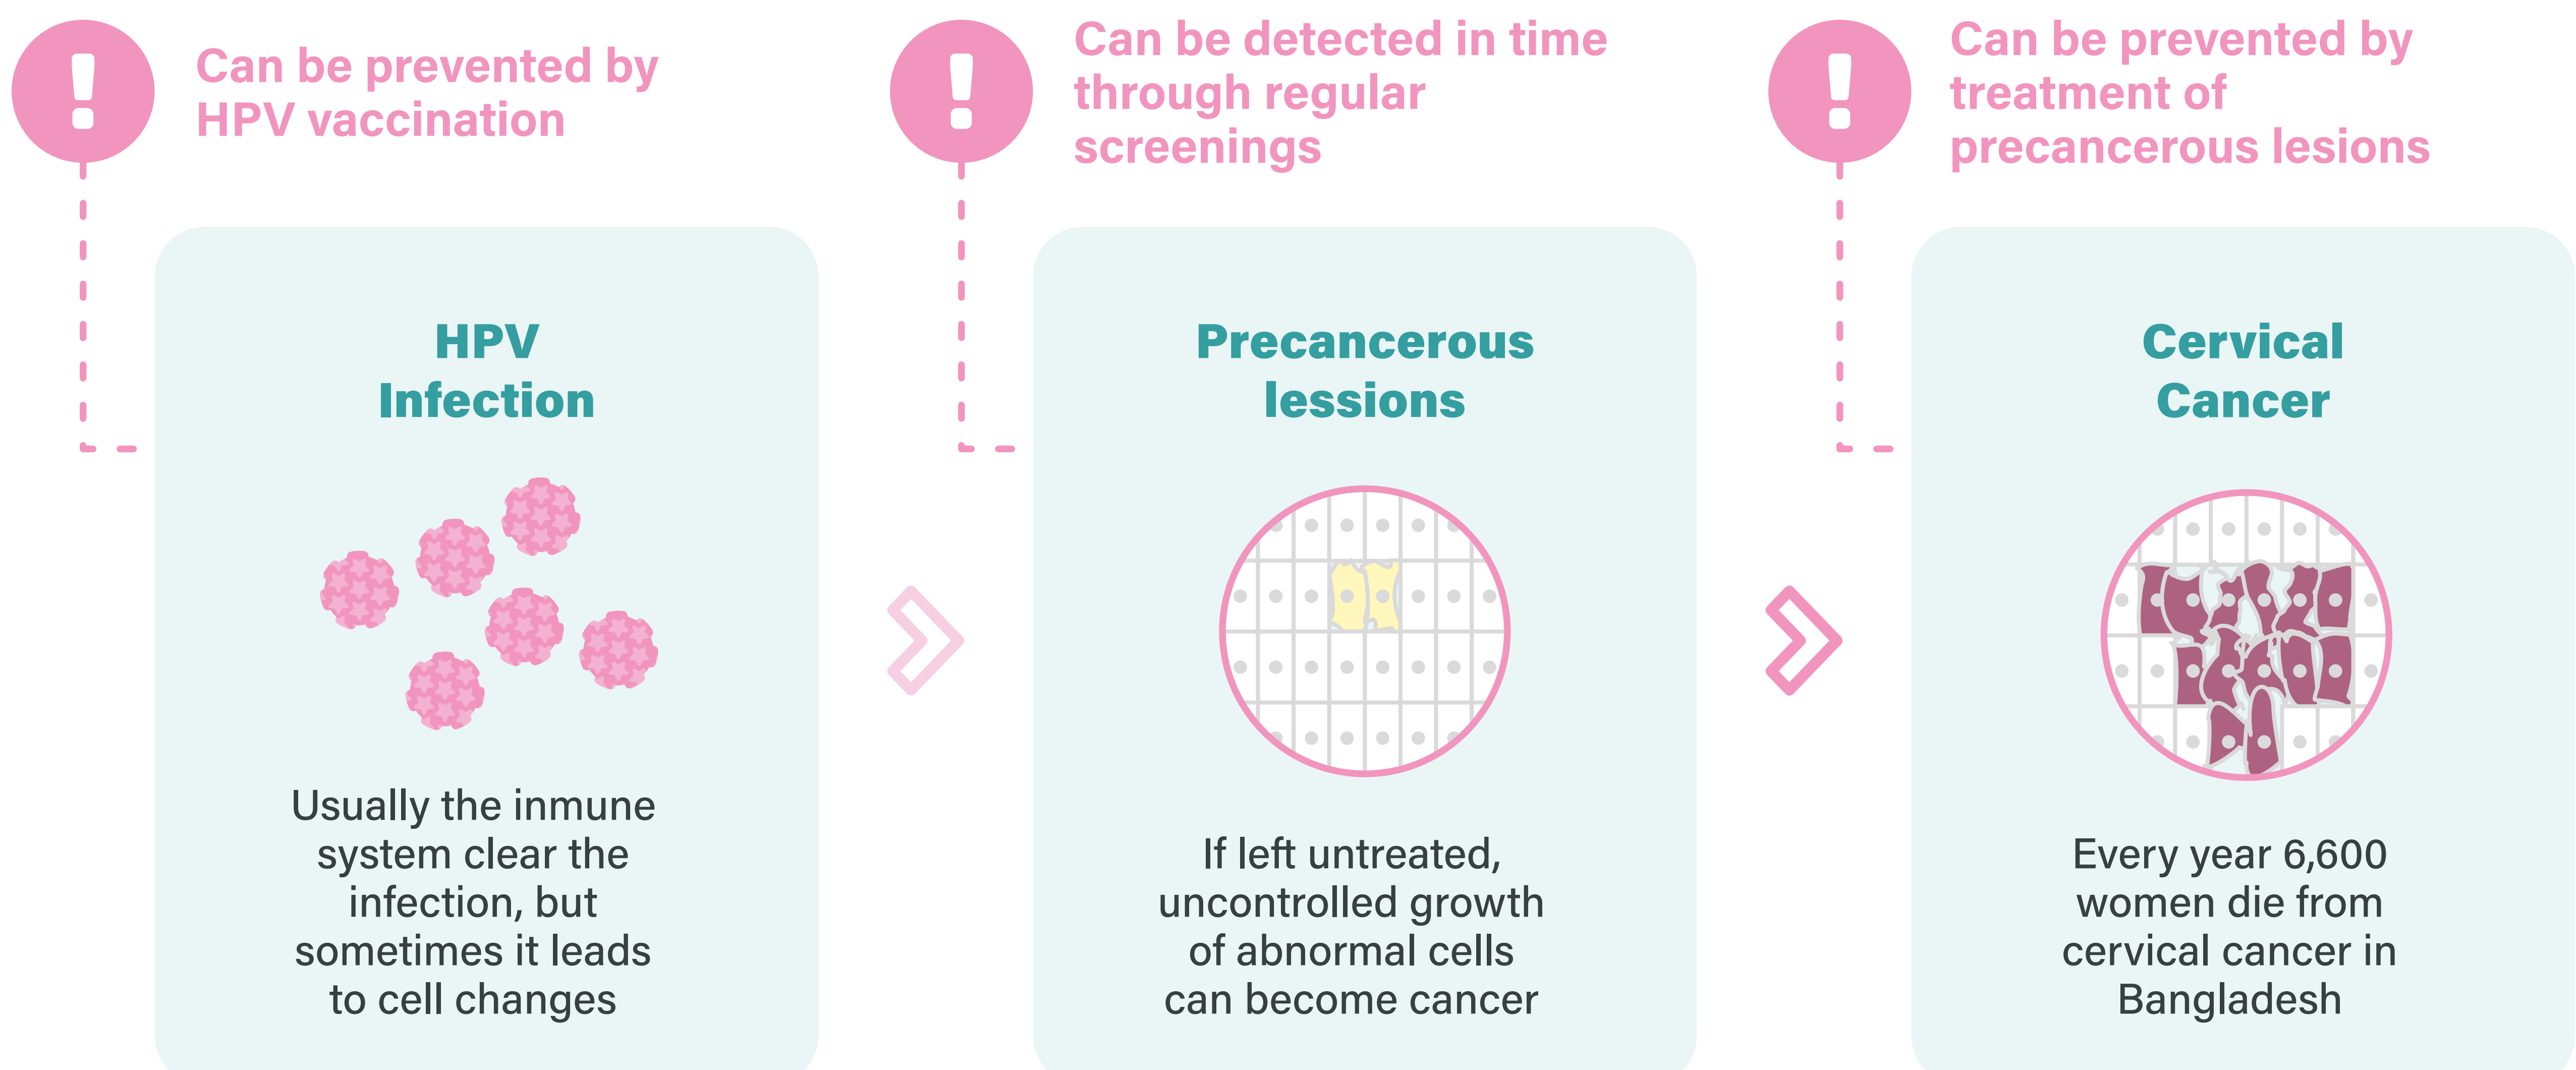

Each day, more than 200 women die from cervical cancer in India. This should not happen because we have all the tools we need to prevent it.

Nearly all cervical cancers are caused by an infection with human papillomavirus (HPV) not successfully controlled by the immune system, which lead to cell changes that, if untreated, become cancer.

POPULATION	FEMALE POPULATION AGED 30-59	NUMBER OF INCIDENT CASES	NUMBER OF DEATHS*	MORTALITY RATE
139 billion	230 million	124 thousand	77,4 thousand	62,42%

### The avoidable path to cervical cancer

## To eliminate cervical cancer as a public health problem we need:

## What is PRESCRIP-TEC doing in India?

Informing and sensitising women about the screening process for higher accessibility and acceptability of the screening programs.

Facilitating self HPV testing at home to make things easier for women living in remote areas.

Introducing artificial intelligence in the gynaecological examination to improve diagnosis precision and to make work easier for health workers.

Providing women who need treatment of cervical lesions immediate assistance.

In India there are the following partners working in PRESCRIP-TEC Project: the Manipal Academy of Higher Education (MAHE), St. John's Medical College, a unit of CBCI Society of Medical Education Bengaluru, Dharmasthala Manjunatheshwara Educational Society Ujire, the Chittaranjan National Cancer Institute, Department of Obstetrics and Gynaecology and the Tata Medical Centre.

## WHERE WE ARE WORKING

- Manipal
- Bangalore
- Kolkata
- Mumbai
- Sikkim
